

Xnet

Launching Wireless Networks

Xnet Communications is an independent technology center. The core business consists of complex solutions in the area of data communications and digital networks. Xnet combines standard-components to provide turn-key-solutions for all requirements in data communications. Xnet is orientated on the industrial standards of UNIX, TCP/IP and of course Mac OS X. Due to the long experience of our staff, Xnet has a long and founded know-how in all areas of data communications: in modern systems, as well as migrating from legacy systems to the most sophisticated architectures.

Project Management:

A team of experienced project managers are ready to do project scoping, project timelines, scheduling and managing installation. Depending on the size and demands of the project, we work with you to set up a client/supplier project team and conduct weekly team meetings and status updates.

AP Access Point Placement & Network Design:

Xnet Networks will survey location and make recommendations as to where WLAN Access Points should be deployed. The placement is to ensure that the WLAN/store network have the maximum impact and can meet your business objectives like operations, wireless ordering, customer networks, and how to increase traffic or sales.

Technical Management and Systemengineers:

A highly skilled and knowledgeable System Engineer is available to go on site at time of installation to oversee network and physical specifications of installation and to ensure project launches successfully.

Network Setup & Security:

Xnet Networks works with you to understand scope of the network being deployed, and creates a site security zones (VLANs) to match network goals. Initial and follow-up network configurations are also set. The retailer system will be in place on day #1 of network operation. This service allows the network manager to focus on the day-to-day management of the network during early deployment stages, with Xnet Networks providing a safety net to ensure all structures are created properly to facilitate network growth as the deployment continues.

Network Configuration Provisioning and Confirmation:

Xnet Networks Customer Service desk will receive incoming calls to assign your network provisioning to ensure all objects and elements of entire IT-system are being published to the site. We then work with our installer field services to confirm network is operating correctly at site. Xnet Networks also reviews the configuration of the network later on to confirm operations have remained stable.
